

Devang Manjramkar

Software Engineer · Flutter Mobile & Full-Stack (Vue / Frappe-ERPNext) · Spec-Driven AI Delivery

📍 Pune, India 📞 +91 8806113283 ✉ manjramkardevang6@gmail.com 🔗 linkedin.com/in/mldev02 🐙 github.com/DevangML

Software Engineer with 2+ years shipping enterprise SaaS across Flutter mobile and modern web (Vue / Frappe-ERPNext), spanning config-driven mobile frameworks, offline-first warehouse operations, and Identity & Access Management. Delivery spans a full warehouse SaaS platform, an IAM/SecOps core-platform surface and four production mobile apps — two years of continuous shipping to enterprise customers. Strong in offline-first architecture, config/JSON-driven UI engines, RBAC and workflow automation, device integration (scanner/OCR/camera), and spec-driven development with coding agents. B.Tech in Artificial Intelligence & Data Science (9.3/10 CGPA), VIT Pune.

EXPERIENCE

Associate Engineer, [ElasticRun](#)

Pune, India · Jul 2024 – Present

Warehouse Management (WMS) — Next-Gen Field App · Flutter

- Rebuilt the warehouse Field App ground-up, migrating it from Material 2 to Material 3 and reworking the operator experience for low-training, glanceable use on the warehouse floor.
- Owned feature delivery end-to-end across all 6 stages of the warehouse lifecycle — GRN/inbound receiving, Putaway, PSR, Picking, STN and returns — on a product live across multiple enterprise SaaS clients. Sustained **~20 tracked items a month for two years at a 99.5% closure rate** (585 of 588 assigned), with scope self-managed rather than assigned daily.
- Engineered offline-first sync with concurrency/conflict control, keeping warehouse operations reliable under low- and no-network conditions; authored the offline design doc adopted by the team.
- Wired 4 high-throughput capture paths — hardware/keyboard scanners, barcode/QR, OCR capture and ambient-light torch switching — removing manual SKU entry from the highest-volume floor operations.
- Drove operator-experience wins from competitor analysis: icon-based internationalisation replacing text localisation for a multilingual warehouse workforce, zero-knowledge UX, and multi-tenant whitelabelling across client brands.

Core Platform — Identity & Access Management (IAM) / SecOps · Vue.js + Frappe/Python

- Delivered **20+ tracked IAM and access-management items** on a security-sensitive platform governing internal user access across the organisation.
- Developed a Vue.js single-page audit and gap-management dashboard on Frappe/ERPNext serving **5 distinct user personas**, covering record creation, multi-step workflows and role-scoped work queues.
- Designed a role-based access and field-level permission layer enforcing per-workflow-state edit rules on top of the Frappe workflow engine.
- Automated IAM lifecycle operations — application-level enable/disable, bulk user actions and change-request validation — connected to an external incident-ticketing system, cutting access-request turnaround from **multi-day manual coordination to same-day self-service**.
- Championed spec-driven development across the team — a spec-first flow keeping AI-assisted work structured and human-directed, measurably reducing post-release defects and lifting unit-test coverage on the modules it covered.

Software Engineer Intern, [ElasticRun](#)

Pune, India · Aug 2023 – Jul 2024

- Built the Campaigns package (Flutter, `er_core_packages`) — a config-driven ad-campaign delivery framework ingesting JSON config from Frappe, compiling it into typed domain objects and local DB tables, matching campaigns against runtime in-app events, and rendering via self-rendering widgets. Adopted across the Sales, Customer, Field and Courier apps and **still in production 2 years on**.
- Launched features across the Sales, Customer and Field apps in Flutter — incentive criteria (AND-condition rules), survey widgets, feedback flows, in-app campaign banners — plus GA4 instrumentation for reliable event tracking.
- Migrated the Courier app to Flutter and built reusable cached components reused across the app ecosystem; authored module test suites (Catalog, Training).

Lead Web Developer, [ActualOne Protocol](#)

Pune, India · Jun 2023 – Aug 2023

- Built and launched the product MVP on a Next.js full-stack architecture as a founding engineer, taking it from **zero to production in 12 weeks** and establishing the frontend and backend foundation the team built on.

- Owned end-to-end delivery from architecture decisions to production deployment, shipping 8 core features that drove product validation with the first 200 users.

Executive Committee Member, IEEE Student Branch, VIT Pune

Pune, India · Jun 2021 – Jun 2022

- Wrote the Node.js backend for the branch website, cutting content-publishing effort for 15+ events a year from hours of manual edits to minutes.
- Shipped a complete event-ticketing system with real-time validation in **24 hours**, processing entry for 500+ attendees at the annual tech event with zero downtime.

SIDE PROJECTS

- **AI Operating System — a generic spec-driven delivery framework.** Built from one observation: agent-assisted delivery fails less from weak models than from weak constraints. Each layer answers a failure mode I hit in practice. *Agents inventing requirements* → a constitution layer where every change maps to a stated acceptance criterion, and nothing is called done on its first pass. *One generalist agent producing shallow work* → an orchestrator composing 2–4 specialist roles per delivery dimension (quality, tests, architecture, adversarial review). *Unverifiable completion* → a layered model from test harness to ship, gated by verification batches whose trace rows flip only when exit tests pass. *Context burned on blind code search* → a retrieval hierarchy putting structured artefacts and a code knowledge graph ahead of scanning. *Improvements getting lost* → an experiment loop that seals proven wins back into the rules layer, so the framework tightens itself.
- **Adaptive Learning System — self-healing agent control loop.** A SENSE → COMPARE → DIAGNOSE → ADAPT → ROLLOVER loop where an agent reads a nightly six-field log, diagnoses drift against plan and re-sequences the next day; spaced repetition, interleaving and leech rules encoded as planner invariants.

TECHNICAL SKILLS

Mobile · Flutter/Dart Offline-first architecture, sync & concurrency control, config/JSON-driven UI engines, package/plugin design, state management, Material 3, barcode/QR/OCR/camera integration, icon-based i18n, whitelabelling / multi-tenant

Web · Full-Stack Vue.js, Frappe/ERPNext, Python, JavaScript/TypeScript, Node.js, Next.js, REST APIs, MariaDB/MySQL, Redis

Platform · Security RBAC & field-level permissions, workflow engines, IAM user-lifecycle automation, audit/governance, change-management workflows, incident-ticketing integration

AI-Native Engineering Spec-driven development, LLM coding agents (Claude Code, Cursor), MCP server integration, context/prompt engineering, agent orchestration

Practices Unit testing & coverage, analytics instrumentation (GA4), R&D spikes, competitor analysis, code review, Git, Docker, CI/CD, Agile/Scrum

EDUCATION & RECOGNITION

B.Tech, Artificial Intelligence & Data Science Vishwakarma Institute of Technology, Pune 2020–2024 · CGPA 9.3/10

- **Kavach 2023 Grand Finalist** — Government of India national hackathon; reached the finals with team Defendify (Indigenous Crypto-Currency Investigation Tool).
- **Polybase Pool Prize, ETHGlobal 2023** — sponsor prize for a team project.
- *A Study on Personality Prediction & Classification Using Data Mining Algorithms* — IEEE Xplore, 2023. ieeexplore.ieee.org/document/10076743
- *A Review of Document Text Search Using Nondeterministic Automata* — EasyChair Preprint, 2022.
