

Devang Manjramkar

Software Engineer · Frontend & Full-Stack (React / Next.js, Vue) · Flutter Mobile · Spec-Driven AI Delivery
Pune, India | +91 8806113283 | manjramkardevang6@gmail.com | linkedin.com/in/mldev02 |
github.com/DevangML

Software Engineer with 2+ years shipping enterprise SaaS across component-driven web SPAs and Flutter mobile. Shipped a production MVP on React/Next.js as founding engineer, built a multi-persona Identity & Access Management dashboard as a JavaScript single-page app (Vue on Frappe/ERPNext), and currently build an internal IAM audit tool on React + Vite. Day-to-day work is the substance a React role runs on: component architecture, props-down/events-up data flow, client-side routing, permission-gated conditional rendering, REST integration, and form- and workflow-heavy enterprise UI at scale. B.Tech in Artificial Intelligence & Data Science (9.3/10 CGPA), VIT Pune.

Technical Skills

Frontend — React, Next.js, Vite, JavaScript (ES6+), TypeScript, Vue.js, component architecture, SPA & client-side routing, state management, REST API integration, HTML/CSS, responsive UI, design-system & white-label theming

Backend & Data — Python, Frappe/ERPNext, Node.js, REST APIs, MariaDB/MySQL, Redis

Mobile — Flutter/Dart: offline-first architecture, sync & concurrency control, config/JSON-driven UI engines, package/plugin design, Material 3, barcode/QR/OCR/camera, multi-tenant white-labelling

Platform & Security — RBAC & field-level permissions, workflow engines, IAM user-lifecycle automation, audit/governance, incident-ticketing integration

AI-Native Engineering — Spec-driven development, LLM coding agents (Claude Code, Cursor), MCP server integration, context/prompt engineering, agent orchestration

Practices — Unit testing & coverage, analytics instrumentation (GA4), code review, Git, Docker, CI/CD, Agile/Scrum

Experience

Associate Engineer, ElasticRun

Pune, India · Jul 2024 – Present

IAM Audit Tool (RECO-4618) · React + Vite · internal platform tool

- Building the internal IAM audit tool as a React + Vite single-page application on top of the existing Frappe/ERPNext IAM backend — component-based UI, client-side routing, and REST-backed data flows.
- Applying the same role-scoped access model as the core platform: permission-gated views and conditional rendering driven by the user's role and workflow state.

Core Platform — Identity & Access Management (IAM) / SecOps · Vue.js SPA + Frappe/Python

- Delivered **20+ tracked IAM and access-management items** on a security-sensitive platform governing internal user access across the organisation.
- Built a single-page audit and gap-management dashboard serving **5 distinct user personas** — component-driven UI, client-side routing, shared reactive state, and role-scoped work queues over REST APIs, covering record creation and multi-step workflows.
- Designed a role-based access and field-level permission layer enforcing per-workflow-state edit rules — permission-gated component trees and conditional rendering on top of the Frappe workflow engine.
- Automated IAM lifecycle operations — application-level enable/disable, bulk user actions and change-request validation — wired to an external incident-ticketing system, cutting access-request turnaround from multi-day manual coordination to **same-day self-service**.
- Championed spec-driven development across the team: a spec-first flow keeping AI-assisted work structured and human-directed, measurably reducing post-release defects and lifting unit-test coverage on the modules it covered.

Warehouse Management (WMS) — Next-Gen Field App · Flutter

- Rebuilt the warehouse Field App ground-up, migrating Material 2 to Material 3 and reworking the operator experience for low-training, glanceable use on the warehouse floor.
- Owned feature delivery end-to-end across all **6 stages** of the warehouse lifecycle — GRN/inbound receiving, Putaway, PSR, Picking, STN and returns — on a product live across multiple enterprise SaaS clients. Sustained ~20 tracked items a month for two years at a **99.5% closure rate (585 of 588 assigned)**, with scope self-managed rather than assigned daily.
- Engineered offline-first sync with concurrency/conflict control, keeping operations reliable under low- and no-network conditions; authored the offline design doc adopted by the team.
- Wired **4 high-throughput capture paths** — hardware/keyboard scanners, barcode/QR, OCR capture and ambient-light torch switching — removing manual SKU entry from the highest-volume floor operations.
- Drove operator-experience wins from competitor analysis: icon-based internationalisation replacing text localisation for a multilingual workforce, zero-knowledge UX, and multi-tenant white-labelling across client brands.

Software Engineer Intern, ElasticRun

Pune, India · Aug 2023 – Jul 2024

- Built the Campaigns package (Flutter, `er_core_packages`) — a config-driven ad-campaign delivery framework ingesting JSON config from Frappe, compiling it into typed domain objects and local DB tables, matching campaigns against runtime in-app events, and rendering via self-rendering widgets. Adopted across the Sales, Customer, Field and Courier apps and still in production 2 years on.
- Launched features across the Sales, Customer and Field apps — incentive criteria (AND-condition rules), survey widgets, feedback flows, in-app campaign banners — plus GA4 instrumentation for reliable event tracking.
- Migrated the Courier app to Flutter and built reusable cached components reused across the app ecosystem; authored module test suites (Catalog, Training).

Lead Web Developer, ActualOne Protocol

Pune, India · Jun 2023 – Aug 2023

- Built and launched the product MVP as founding engineer on a **React / Next.js** full-stack architecture — zero to production in 12 weeks, establishing the frontend component structure, routing and API layer the team built on.
- Owned end-to-end delivery from architecture decisions to production deployment, shipping **8 core features** that drove product validation with the first **200 users**.

Executive Committee Member, IEEE Student Branch, VIT Pune

Pune, India · Jun 2021 – Jun 2022

- Wrote the Node.js backend for the branch website, cutting content-publishing effort for 15+ events a year from hours of manual edits to minutes.
- Shipped a complete event-ticketing system with real-time validation in 24 hours, processing entry for **500+ attendees** at the annual tech event with zero downtime.

Side Projects

- **AI Operating System** — a generic spec-driven delivery framework, built on one observation: agent-assisted delivery fails less from weak models than from weak constraints. A constitution layer maps every change to a stated acceptance criterion; an orchestrator composes 2–4 specialist roles per delivery dimension (quality, tests, architecture, adversarial review); verification batches gate completion; a retrieval hierarchy puts structured artefacts and a code knowledge graph ahead of blind code search; an experiment loop seals proven wins back into the rules layer.
- **Adaptive Learning System** — self-healing agent control loop. A SENSE → COMPARE → DIAGNOSE → ADAPT → ROLLOVER loop in which an agent reads a nightly six-field log, diagnoses drift against plan and re-sequences the next day; spaced repetition, interleaving and leech rules encoded as planner invariants.

Education & Recognition

B.Tech, Artificial Intelligence & Data Science — Vishwakarma Institute of Technology, Pune 2020–2024 · CGPA 9.3/10

- **Kavach 2023 Grand Finalist** — Government of India national hackathon; reached the finals with team Defendify (Indigenous Crypto-Currency Investigation Tool).
- **Polybase Pool Prize, ETHGlobal 2023** — sponsor prize for a team project.
- *A Study on Personality Prediction & Classification Using Data Mining Algorithms* — IEEE Xplore, 2023. ieeexplore.ieee.org/document/10076743
- *A Review of Document Text Search Using Nondeterministic Automata* — EasyChair Preprint, 2022.
